AMENDMENTS TO THE CLAIMS

This listing of claims will replace all prior versions, and listings, of claims in the application:

Complete Listing of Claims:

1. (Currently Amended) A sash balance shoe comprising:
 - a housing having a first length, adapted for moving along a second length of a window frame track positioned in a window frame, wherein said housing is integral to said window frame and not integral to the sash,
 - a first elastic element comprising a first end attached to said housing against movement in said housing along the first length, and a second end attached to a first pulley block that is movable in said housing along said first length,
 - a second pulley block mounted in said housing fixed against movement in said housing along said first length, spaced from said first pulley block,
 - a second element mounted in said second pulley block, rotatable about a first axis through said second pulley block by rotation of the sash out of the window frame when said second element is connected to the sash and the housing is mounted on the track[.], and
 - a cord operatively connected with said first and second pulley blocks.
2. (Original) The sash balance shoe of claim 1 further comprising:
means for braking, configured for lateral extension from said second pulley block in response to rotation of said second element for engaging the frame for, preventing movement of said housing along the second length of the window frame track.
3. (Original) The sash balance shoe of claim 1 further comprising:

Serial No.: 10/626,847
Art Unit: 3676

a bearing surface in said second pulley block for receiving said second element for rotation of said second element on said first axis.

4. (Original) The sash balance shoe of claim 1 further comprising:

a bearing surface integrally molded with said second pulley block, for receiving said second element for rotation of said second element on said first axis.

5. (Currently Amended) The sash balance shoe of claim 1 further comprising:

said housing comprising a front wall, a first side wall attached to said front wall and a second side wall attached to said front wall, extending generally U-shape in cross section on three sides of each of said elastic element, said first pulley block and said second pulley block,

means for connecting said second element to the sash extending from said second element along said first axis generally normal to said front wall so that when said housing is mounted on said window frame track for moving along the second length, and said means for connecting is attached to the sash, ~~the an open side of said housing~~ opposite to the front wall is covered by the track.

6. (Currently Amended) The sash balance shoe of claim 1 further comprising:

said housing comprising a front wall, a first side wall attached to said front wall and a second side wall attached to said front wall, extending generally U-shape in cross section on three sides of each of said elastic element, said first pulley block and said second pulley block,

means for connecting said second element to the sash, extending along said first axis generally normal to said front wall, traversing said front wall, so that when said housing is mounted on the track for moving along the second length[,] and said means for connecting is attached to the sash, the elastic element, first pulley block, and at least a portion of the second pulley block are enclosed by said housing and the track when the sash is parallel to the track and when the sash is rotated out of the window frame.

Serial No.: 10/626,847
Art Unit: 3676

7. (Original) The sash balance shoe of claim 1 further comprising:

means for guiding said housing in said track integrally molded on said second pulley block extending laterally to the first length.

8. (Currently Amended) A sash balance shoe comprising:

a housing having a first end, a second end and a first length from said first end to said second end, adapted for moving along a second length of a window frame track positioned in a window frame, the first length parallel to the second length, wherein said housing is integral to said window frame and not integral to the sash,

an elastic element having a second first end attached to the housing against movement in said housing along said first length, and having a third second end attached to a first pulley block that is movable in said housing along said first length,

a second pulley block mounted in said housing fixed against movement in said housing along said first length, spaced from said first pulley block,

a cam mounted in said second pulley block, rotatable about a first axis in response to rotation of the sash out of the window frame when said cam is connected to the sash,

a cord having a first end attached to one of said first pulley block and said second pulley block, wrapped around a first pulley in said first pulley block, wrapped around a second pulley in said second pulley block, extending from said housing for attachment of a second end of said cord to the window frame when said housing is mounted on the track for movement along the track.

9. (Original) The sash balance shoe of claim 8 further comprising:

said housing comprising a front wall, a first side wall attached to said front wall and a second side wall attached to said front wall, extending generally U-shape in cross section on three sides of each of said elastic element, said first pulley block and said second pulley block,

Serial No.: 10/626,847
Art Unit: 3676

means for connecting said cam to the sash extending along said first axis generally normal to said front wall, traversing said front wall, so that when said housing is mounted on the track for moving along the second length, and said means for connecting is attached to the sash, the elastic element, first pulley block and at least a portion of said second pulley block are enclosed by said housing and the track when the sash is parallel to the track and when the sash is rotated out of the window frame.

10. (Original) The sash balance shoe of claim 9 further comprising:

means for guiding said housing in said track integrally molded on said second pulley block extending laterally to the first length.
